

Guana Island

BVITIPA009

Country: **British Virgin Islands**

Administrative region: **Guana (Island)**

Central co-ordinates: **18.47600 N, -64.57042 E**

Area: **2.93km²**

Qualifying IPA criteria

A(i), B(ii)

IPA assessment rationale

The entirety of Guana Island has been identified as a TIPA for its botanical richness and presence of globally threatened and endemic species. Guana Island have two of BVI's nationally threatened habitats, Coastal shrubland and Mangroves, but it did not qualify under TIPAs sub-criterion C(iii), as the areas are small and not of national significance.

Site description

The entirety of Guana Island has been identified as a TIPA. Since 1935, the island has been privately owned and mostly uninhabited.

Botanical significance

The BVI endemic bromeliad *Pitcairnia jareckii* (EN), which only occurs on Guana Island, Great Camanaoe and the Hawks Nest area on Tortola, is found on the northern hills of Sugar Loaf Peak in the east of Guana Island in the Seasonally deciduous forests and woodlands. The Puerto Rican Bank endemics *Bastardiopsis eggersii* (EN) and *Malpighia woodburyana* (VU), also grow here. On the southern hills of Sugar Loaf Peak towards Bigelow Beach, Monkey Point, Pinguin Ghut and Harris Ghut there is a large population of the Puerto Rican Bank endemic *Agave missionum* (VU). The Virgin Islands endemic *Reynosa guama* (NT) grows in this area along with the Puerto Rican Bank endemics *Rondeletia pilosa* (NT) and

Psychilis macconnelliae (NT). In the White Bay area, the Puerto Rican Bank endemic *Argythamnia stahlia* (VU) has been observed growing in the understory. On the northernmost tip of the island between Land's End and Long Point, one can find a population of the rare Greater Antilles endemic *Sabal causiarum* (VU). In the BVI, this palm is only found here and in isolated areas on the islands of Anegada, Scrub and Tortola.

Habitat and geology

Guana Island have two of BVI's nationally threatened habitats, Coastal shrubland and Mangroves, but it did not qualify under TIPAs sub-criterion C(iii), as the areas are small and not of national significance. Most of Guana Island (>80%) is covered in Seasonally deciduous forests and woodlands.

Conservation issues

The main threats to this TIPA are urban development and grazing of the vegetation by feral animals. Guana Island's first settlement was in the 18th century for sugarcane farming. Since 1935, the island has been privately owned and apart from the resort area and access roads between White Bay and North Bay on the western side of the island, the rest of the island remained uninhabited and large development is unlikely at present. Goats were removed from the island in the early 1900s, but sheep remained and an eradication programme is under way.
